Task 2

1. What testing framework did you find?
    : I found out Pytest as one of the testing frameworks. In general, the test framework makes it easy to write and run tests on a small scale, and Pytest is a convenient and helpful Python testing tool for users to write programs by extending complex tests for applications and libraries.

2. Did you find any differences between that framework and unittest?
    : Pytest belongs to a larger category than unittest. Just as most of the tests performed by unittest can be implemented in Pytest, Pytest includes the ability to test software at all levels in detail. In particular, Pytest shows the test results in the form of code snippets on the console and highlights errors, which is more convenient for users to use.
